# 1 Introduction

## 1.1 Overview

The scope of the Bluetooth is to describe the security functionality of Bluetooth technology in terms of [ ] and to define functional and assurance requirements for the Bluetooth capability of mobile devices and operating systems. This is intended for use with the following s:

- General Purpose Operating System (GPOS) Protection Profile, Version 4.2.1
- Mobile Device Fundamentals (MDF) Protection Profile, Version 3.1

These s are valid because consumer-grade desktop and mobile devices may both have Bluetooth hardware radios and so both desktop and mobile operating systems have the software/firmware capability to allow products to use them.

## 1.2 Terms

The following sections list Common Criteria and technology terms used in this document.

### 1.2.1 Common Criteria Terms

Assurance	Grounds for confidence that a TOE meets the SFRs <a href="#">[CC]</a> .
Base Protection Profile (Base-PP)	Protection Profile used as a basis to build a PP-Configuration.
Common Criteria (CC)	Common Criteria for Information Technology Security Evaluation (International Standard ISO/IEC 15408).
Common Criteria Testing Laboratory	Within the context of the Common Criteria Evaluation and Validation Scheme (CCEVS), an IT security evaluation facility, accredited by the National Voluntary Laboratory Accreditation Program (NVLAP) and approved by the NIAP Validation Body to conduct Common Criteria-based evaluations.
Common Evaluation Methodology (CEM)	Common Evaluation Methodology for Information Technology Security Evaluation.
Distributed TOE	A TOE composed of multiple components operating as a logical whole.
Operational Environment (OE)	Hardware and software that are outside the TOE boundary that support the TOE functionality and security policy.
Protection Profile (PP)	An implementation-independent set of security requirements for a category of products.
Protection Profile Configuration (PP-Configuration)	A comprehensive set of security requirements for a product type that consists of at least one Base-PP and at least one PP-Module.
Protection Profile Module (PP-Module)	An implementation-independent statement of security needs for a TOE type complementary to one or more Base Protection Profiles.
Security Assurance Requirement (SAR)	A requirement to assure the security of the TOE.
Security Functional Requirement (SFR)	A requirement for security enforcement by the TOE.
Security Target (ST)	A set of implementation-dependent security requirements for a specific product.

TOE Security Functionality (TSF)	The security functionality of the product under evaluation.
TOE Summary Specification (TSS)	A description of how a TOE satisfies the SFRs in an ST.
Target of Evaluation (TOE)	The product under evaluation.

### 1.2.2 Technical Terms

Authentication	Verifying the identity of communicating devices based on their Bluetooth address. Bluetooth does not provide native user authentication.
Authorization	Allowing the control of resources by ensuring that a device is authorized to use a service before permitting it to do so.
BD_ADDR	The Bluetooth device Address, which is used to identify a Bluetooth device.
BR/EDR	Bluetooth basic rate (BR) and enhanced data rate (EDR).
BR/EDR Controller	A term referring to the Bluetooth Radio, Baseband, Link Manager, and HCI layers.
BR/EDR Piconet Physical Channel	A Channel that is divided into time slots in which each slot is related to an RF hop frequency. Consecutive hops normally correspond to different RF hop frequencies and occur at a standard hop rate of 1600 hops per second. These consecutive hops follow a pseudo-random hopping sequence, hopping through a 79 RF channel set, or optionally fewer channels when Adaptive Frequency Hopping (AFH) is in use. BR/EDR/LE Bluetooth basic rate (BR), enhanced data rate (EDR) and low energy (LE).
Bluetooth	A wireless communication link operating in the unlicensed ISM band at 2.4 GHz using a frequency hopping transceiver. It allows real-time AV and data communications between Bluetooth Hosts. The link protocol is based on time slots.
Bluetooth Baseband	The part of the Bluetooth system that specifies or implements the medium access and physical layer procedures to support the exchange of real-time voice, data information streams, and ad hoc networking between Bluetooth devices.
Bluetooth Controller	A generic term referring to a Primary Controller with or without a Secondary Controller.
Bluetooth Device	A device that is capable of short-range wireless communications using the Bluetooth system.
Bluetooth Device Address	A 48 bit address used to identify each Bluetooth device.
Connect (to service)	The establishment of a connection to a service. If not already done, this also includes establishment of a physical link, logical transport, logical link and L2CAP channel.
Connectable device	A BR/EDR device in range that periodically listens on its page scan physical channel and will respond to a page on that channel. An LE device that is advertising using a connectable advertising event.
Connected devices	Two BR/EDR devices and with a physical link between them. Connecting A phase in the communication between devices when a connection between the devices is being established. The connecting phase follows after the link establishment phase is completed.
Connection	An interaction between two peer applications or higher layer protocols mapped onto an L2CAP channel.
Connection establishment	A procedure for creating a connection mapped onto a channel.
Connection event	A series of one or more pairs of interleaving data packets sent between a master and a slave on the same physical channel.
Creation of a secure connection	A procedure of establishing a connection, including authentication and encryption.

Creation of a trusted relationship	A procedure where the remote device is marked as a trusted device. This includes storing a common link key for future authentication, or pairing, when a link key is not available.
Device discovery	A procedure for retrieving the Bluetooth device address, clock, class-of-device field and used page scan mode from discoverable devices.
Discoverable Mode	A Bluetooth device that is performing inquiry scans in BR/EDR or advertising with a discoverable or connectable advertising event with a discoverable flag set in LE.
Discoverable device	A BR/EDR device in range that periodically listens on an inquiry scan physical channel and will respond to an inquiry on that channel. An LE device in range that is advertising with a connectable or scannable advertising event with a discoverable flag set in the advertising data. This device is in the discoverable mode.
Discovery procedure	A Bluetooth device that is carrying out the inquiry procedure in BR/EDR or scanning for advertisers using a discoverable or connectable advertising event with a discoverable flag set in LE.
Host	A logical entity defined as all of the layers below the non-core profiles and above the Host Controller interface (HCI); i.e. Bluetooth Host attached to a Bluetooth Controller may communicate with other Bluetooth Hosts attached to their Controllers as well.
L2CAP Channel	A logical connection on L2CAP level between two devices serving a single application or higher layer protocol.
L2CAP Channel establishment	A procedure for establishing a logical connection on L2CAP level.
LMP authentication	An LMP level procedure for verifying the identity of a remote device.
LMP pairing	A procedure that authenticates two devices and creates a common link key that can be used as a basis for a trusted relationship or a (single) secure connection.
Link	Shorthand for a logical link.
Link establishment	A procedure for establishing the default ACL link and hierarchy of links and channels between devices.
Link key	A secret that is known by two devices and is used to authenticate the link.
Logical Link Control and Adaptation Protocol (L2CAP)	A data link protocol used in the Bluetooth protocol stack.
Logical link	The lowest architectural level used to offer independent data transport services to clients of the Bluetooth system.
Name discovery	A procedure for retrieving the user-friendly name (the Bluetooth device name) of a connectable device.
OBEX Push	A method of Bluetooth one-way file transfer that is initiated by the entity that is providing the file.
PIN	A user-friendly value that can be used to authenticate connections to a device before pairing has taken place.
Paired device	A Bluetooth device for which a link key has been created (either before connection establishment was requested or during connecting phase).
Piconet	A collection of devices occupying a shared physical channel where one of the devices is the Piconet Master and the remaining devices are connected to it.
Piconet Master	The BR/EDR device in a piconet whose Bluetooth Clock and Bluetooth Device Address are used to define the piconet physical channel characteristics.
Piconet Slave	Any BR/EDR device in a piconet that is not the Piconet Master, but is connected to the Piconet Master.
RFCOMM	A transport protocol used in the Bluetooth protocol stack that emulates RS-232 serial port connections.
Trusted Device	A device that has a fixed relationship with another device and has full access to all services.

Unknown device	A Bluetooth device for which no information (Bluetooth Device Address, link key or other) is stored.
Untrusted Device	A device that does not have an established relationship with another Bluetooth device, which results in the untrusted device receiving restricted access to services.

## 1.3 Compliant Targets of Evaluation

---

The Target of Evaluation (TOE) in this is a product that implements Bluetooth functionality. This describes the extended security functionality of Bluetooth in terms of CC. This PP-Module extends the Protection Profile for General Purpose Operating Systems or Mobile Device Fundamentals. A compliant TOE will meet all mandatory SFRs defined in this PP-Module in addition to the mandatory SFRs of its claimed Base-PP. For each Base-PP, this PP-Module refines several of the Base-PP's SFRs so that they can accommodate the Bluetooth functionality defined by the PP-Module. A compliant TOE will claim all selection-based SFRs from this PP-Module and its Base-PP as needed based on the relevant selections in other requirements being chosen.

Note that [MDF], evaluation activities require certain tests to be performed against all radios present on the device. When the TOE also claims conformance to this PP-Module, those tests are executed against the Bluetooth radio as well.

Also note that each Base-PP defines its own requirements for protection of data at rest. When the TOE also claims conformance to this PP-Module, any data that is used by the TOE's Bluetooth implementation is expected to be stored using the same protection mechanisms.

### 1.3.1 TOE Boundary

The Bluetooth implementation is a logical component executing on an end user personal computing or mobile device. As such, the TOE must rely heavily on the TOE's operational environment (host platform, network stack, and operating system) for its execution domain and its proper usage. The TOE will rely on the IT environment to address much of the security functionality related to administrative functions. The physical boundary of the TOE includes the physical device on which it is installed, as this device will contain an internal or external Bluetooth radio that is used as the physical medium for transmitting and receiving data over the Bluetooth logical channel.

## 1.4 Use Cases

---

Requirements in this PP-Module are designed to address the security problems in at least the following use cases. These use cases are intentionally very broad, as many specific use cases exist within these larger categories.

### [USE CASE 1] General-Purpose Operating System

This use case is for a Bluetooth TOE that is part of a general-purpose operating system. Specifically, the Bluetooth TOE is expected to be part of the operating system itself and not a standalone third-party application that is installed on top of it.

### [USE CASE 2] Mobile Device

This use case is for a Bluetooth TOE that is part of a mobile operating system that runs on a mobile device. Specifically, the Bluetooth TOE is expected to be part of the mobile operating system itself and not a standalone third-party application that is acquired from the mobile vendor's application store.

# 2 Conformance Claims

## Conformance Statement

This PP-Module inherits exact conformance as required from the specified Base-PP and as defined in the CC and CEM addenda for Exact Conformance, Selection-Based SFRs, and Optional SFRs (dated May 2017).

The following PPs and PP-Modules are allowed to be specified in a PP-Configuration with this PP-Module.

- [Mobile Device Fundamentals, version 3.1](#)
- [General Purpose Operating Systems, version 4.2.1](#)

## CC Conformance Claims

This is conformant to Parts 2 (extended) and 3 (conformant) of Common Criteria Version 3.1, Revision 5.

## PP Claim

This does not claim conformance to any Protection Profile.

## Package Claim

This does not claim conformance to any packages.

## Conformance Statement

This inherits exact conformance as required from the specified and as defined in the and addenda for Exact Conformance, Selection-Based SFRs, and Optional SFRs (dated May 2017).

The following PPs and PP-Modules are allowed to be specified in a PP-Configuration with this PP-Module.

- PP-Module for VPN Client, Version 2.1
- PP-Module for MDM Agent, Version 1.0
- PP-Module for WLAN Clients, Version 1.0

## CC Conformance Claims

This is conformant to Parts 2 (extended) and 3 (conformant) of Common Criteria Version 3.1, Release 5 [ ].

## Package Claims

There are no package claims for this PP-Module.

# 3 Security Problem Description

All threats, assumptions, organizational security policies, and/or objectives that apply to this PP-Module are inherited from the Base-PP to which the TOE also conforms. This PP-Module does not add or remove any elements to the security problem definition given in the Base-PP. The SFRs defined in this PP-Module provide additional mechanisms for mitigating the threats already defined in the Base-PPs due to the fact that including a Bluetooth implementation introduces a new external interface to the underlying general-purpose OS or mobile device platform.

## 3.1 Threats

---

No threats have been identified that are specific to Bluetooth technology. However, any organizational security policies defined in the Base-PPs will also apply to the portion of the TOE that implements Bluetooth.

**T.PLACEHOLDER**  
placeholder

## 3.2 Assumptions

---

This PP-Module defines no additional assumptions.  
This document does not define any additional assumptions.

## 3.3 Organizational Security Policies

---

An organization deploying the TOE is expected to satisfy the organizational security policy listed below in addition to all organizational security policies defined by the claimed base PP.

**P.PLACEHOLDER**  
No organizational policies have been identified that are specific to Bluetooth technology. However, any objectives defined in the Base-PPs will also apply to the portion of the TOE that implements Bluetooth.

# 4 Security Objectives

## 4.1 Security Objectives for the TOE

---

O.PLACEHOLDER  
placeholder

## 4.2 Security Objectives for the Operational Environment

---

This PP-Module does not define any objectives for the Operational Environment.

No environmental security objectives have been identified that are specific to Bluetooth technology. However, any environmental security objectives defined in the Base-PPs will also apply to the portion of the TOE that implements Bluetooth.

## 4.3 Security Objectives Rationale

---

This section describes how the assumptions, threats, and organization security policies map to the security objectives.

Table 1: Security Objectives Rationale

Threat, Assumption, or OSP	Security Objectives	Rationale
T.PLACEHOLDER	O.PLACEHOLDER	placeholder
P.PLACEHOLDER	O.PLACEHOLDER	aaaaa

# 5 Security Requirements

This chapter describes the security requirements which have to be fulfilled by the product under evaluation. Those requirements comprise functional components from Part 2 and assurance components from Part 3 of [CC]. The following conventions are used for the completion of operations:

- **Refinement** operation (denoted by **bold text** or ~~striktthrough text~~): is used to add details to a requirement (including replacing an assignment with a more restrictive selection) or to remove part of the requirement that is made irrelevant through the completion of another operation, and thus further restricts a requirement.
- **Selection** (denoted by *italicized text*): is used to select one or more options provided by the [CC] in stating a requirement.
- **Assignment** operation (denoted by *italicized text*): is used to assign a specific value to an unspecified parameter, such as the length of a password. Showing the value in square brackets indicates assignment.
- **Iteration** operation: is indicated by appending the SFR name with a slash and unique identifier suggesting the purpose of the operation, e.g. "/EXAMPLE1."

## 5.1 MDF PP Security Functional Requirements Direction

In a PP-Configuration that includes MDF PP, the TOE is expected to rely on some of the security functions implemented by the Mobile Device as a whole and evaluated against the MDF PP. The following sections describe any modifications that the ST author must make to the SFRs defined in the MDF PP in addition to what is mandated by [Section 5.3 TOE Security Functional Requirements](#).

### 5.1.1 Modified SFRs

The SFRs listed in this section are defined in the MDF PP and relevant to the secure operation of the TOE.

#### 5.1.1.1 Security Audit (FAU)

##### FAU\_GEN.1 Audit Data Generation

FAU\_GEN.1.1

In addition to the auditable events defined in the [MDF PP], the mobile device shall generate audit records for audit events related to Bluetooth functionality. A conformant TOE shall append Table 1 in the [MDF PP] with the following mandatory auditable events:

Requirement	Auditable Events	Additional Audit Record Contents
<a href="#">FCS_CKM_EXT.8</a>	None.	
<a href="#">FIA_BLT_EXT.1</a>	Failed user authorization of Bluetooth device.	User authorization decision (e.g., user rejected connection, incorrect pin entry).
	Failed user authorization for local Bluetooth Service.	Bluetooth address and name of device. Bluetooth profile. Identity of local service with [ <b>selection</b> : <i>service ID, profile name</i> ].
<a href="#">FIA_BLT_EXT.2</a>	Initiation of Bluetooth connection.	Bluetooth address and name of device.
	Failure of Bluetooth connection.	Reason for failure.
<a href="#">FIA_BLT_EXT.3</a> (optional)	Duplicate connection attempt.	BD_ADDR of connection attempt.
<a href="#">FIA_BLT_EXT.4</a>	None.	
<a href="#">FIA_BLT_EXT.5</a> (if claimed)	None.	
<a href="#">FIA_BLT_EXT.6</a>	None.	

<a href="#">FIA_BLT_EXT.7</a>	None.
<a href="#">FTP_BLT_EXT.1</a>	None.
<a href="#">FTP_BLT_EXT.2</a>	None.
<a href="#">FTP_BLT_EXT.3/BR</a>	None.
<a href="#">FTP_BLT_EXT.3/LE</a> (if claimed)	None.

**Application Note:** It is not feasible for the FIA\_BLT\_EXT.3 event to be audited if the rejection is performed at the HCI layer because the Bluetooth standard does not provide a notification interface for this behavior in the HCI. This is why the event is labeled as optional. However, if the rejection is performed above the HCI layer, it is expected that a conformant TOE should implement this functionality.

### 5.1.1.2 Security Management (FMT)

#### FMT\_SMF\_EXT.1 Specification of Management Functions

FMT\_SMF\_EXT.1.1

This PP-Module prescribes the following changes to this SFR as defined in the Base-PP:

- The list of radios specified in the assignment for management function 4 ("enable/disable [**assignment:** *list of all radios*]") will include Bluetooth radios. Bluetooth BR/EDR and Bluetooth LE will be listed separately if the TSF provides the ability to enable/disable them separately (i.e., if management function BT-3 below is claimed). Otherwise, both interfaces will be treated as one radio for that assignment.
- The following additional management functions are defined, and should be appended to the table in the Base-PP:

Function	FMT_SMF_EXT.1	FMT_MOF_EXT.1.1	Admin	FMT_MOF_EXT.1.2
BT-1. Configure the Bluetooth trusted channel. <ul style="list-style-type: none"> <li>• Disable/enable the Discoverable (for BR/EDR) and Advertising (for LE) modes;</li> </ul>	M	O	O	O
BT-2. Change the Bluetooth device name (separately for BR/EDR and LE);	O	O	O	O
BT-3. Provide separate controls for turning the BR/EDR and LE radios on and off;	O	O	O	O
BT-4. Allow/disallow the following additional wireless technologies to be used with Bluetooth: [ <b>selection:</b> <i>Wi-Fi, NFC</i> , [ <b>assignment:</b> <i>other wireless technologies</i> ]];	O	O	O	O
BT-5. Configure allowable methods of Out of Band pairing (for BR/EDR and LE);	O	O	O	O
BT-6. Disable/enable the Discoverable (for BR/EDR) and Advertising (for LE) modes separately;	O	O	O	O
BT-7. Disable/enable the Connectable mode (for BR/EDR and LE);	O	O	O	O
BT-8. Disable/enable the Bluetooth [ <b>assignment:</b> <i>list of Bluetooth service and/or profiles available on the OS (for BR/EDR and LE)</i> ];	O	O	O	O
BT-9. Specify minimum level of security for each pairing (for BR/EDR and LE);	O	O	O	O

**Application Note:** As is the case with the [MDF PP], the first column lists the management function, the second column lists whether it is mandatory to implement the function and the remaining columns indicate whether it is mandatory, optional, or prohibited to implement the function by role as follows:

- The third column indicates functions that are to be restricted to the user (i.e. not available to the administrator).
- The fourth column indicates functions that are available to the administrator. These functions can still be available to the user, as long as the function is not restricted to the administrator (column 5).
- The fifth column indicates whether the function is to be restricted to the administrator when the device is enrolled and the administrator applies the indicated policy (i.e., MDM administration). This does not prevent the user from modifying a setting to make the function stricter, but the user cannot undo the configuration enforced by the administrator.

For columns 2-5, an 'M' indicates that it is mandatory, an 'O' indicates that it is optional, and a '-' indicates that it is prohibited.

(BT-1.) Management of the Discoverable and Advertising mode and management of the Bluetooth device name are mandatory. All other management functions for Bluetooth are currently objective.

(BT-2. optional) Requires management of the Bluetooth device name separately for BR/EDR and LE radios.

(BT-4. optional) May include disabling Wi-Fi being used as a part of Bluetooth High Speed and/or disabling NFC as an Out of Band pairing method for Bluetooth. May also include other wireless technologies beyond those already specified.

(BT-8. optional) The Bluetooth services and/or profiles that may be disabled should be listed for the user or administrator either by service and/or profile name or by the types of applications for which the service and/or profile is used.

(BT-9. optional) The minimum level of security permitted may be configurable for each individual pairing or for all Bluetooth pairings.

- If the TSF supports any of the BR/EDR security modes in the following list; it should provide a mechanism for the user to choose the minimum level of security to enforce for a particular device during the pairing process: Security Mode 1 (any level); Security Mode 2; (any level); Security Mode 3; (any level); Security Mode 4; Levels 0;1;2 (aside from the services permitted to use Mode 4; Level 0 in Bluetooth Core Specification version 4.2; Vol. 3; Part C; p. 325).
- If the TSF supports any of the LE security modes in the following list; it should provide a mechanism for the user to choose the minimum level of security to enforce for a particular device during the pairing process: Security Mode 1: Levels 1, 2; Security Mode 2, (any level).
- Examples of levels of security are the use of legacy pairing; the use of different types of Secure Simple Pairing; a requirement for Man-in-the-Middle protection; the enforcement of Secure Connections Only mode; etc.

## 5.1.2 Additional SFRs

---

This PP-Module does not define any additional SFRs for any PP-Configuration where the MDF PP is claimed as the Base-PP.

## 5.2 GPOS PP Security Functional Requirements Direction

---

In a PP-Configuration that includes GPOS PP, the TOE is expected to rely on some of the security functions implemented by the Operating System as a whole and evaluated against the GPOS PP. The following sections describe any modifications that the ST author must make to the SFRs defined in the GPOS PP in addition to what is mandated by [Section 5.3 TOE Security Functional Requirements](#).

### 5.2.1 Modified SFRs

---

The SFRs listed in this section are defined in the GPOS PP and relevant to the secure operation of the TOE.

#### 5.2.1.1 Security Audit (FAU)

##### FAU\_GEN.1 Audit Data Generation

In addition to the auditable events defined in the [GPOS PP], the OS shall generate audit records for the following audit events related to Bluetooth functionality:

Requirement	Auditable Events	Additional Audit Record Contents
<a href="#">FCS_CKM_EXT.8</a>	None.	
<a href="#">FIA_BLT_EXT.1</a>	Failed user authorization of Bluetooth device.	User authorization decision (e.g., user rejected connection, incorrect pin entry).
	Failed user authorization for local Bluetooth Service.	Bluetooth address and name of device. Bluetooth profile. Identity of local service with [ <b>selection:</b> <i>service ID, profile name</i> ].
<a href="#">FIA_BLT_EXT.2</a>	Initiation of Bluetooth connection.	Bluetooth address and name of device.
	Failure of Bluetooth connection.	Reason for failure.
<a href="#">FIA_BLT_EXT.3</a> (optional)	Duplicate connection attempt.	BD_ADDR of connection attempt.
<a href="#">FIA_BLT_EXT.4</a>	None.	
<a href="#">FIA_BLT_EXT.5</a> (if claimed)	None.	
<a href="#">FIA_BLT_EXT.6</a>	None.	
<a href="#">FIA_BLT_EXT.7</a>	None.	
<a href="#">FTP_BLT_EXT.1</a>	None.	
<a href="#">FTP_BLT_EXT.2</a>	None.	
<a href="#">FTP_BLT_EXT.3/BR</a>	None.	
<a href="#">FTP_BLT_EXT.3/LE</a> (if claimed)	None.	

**Application Note:** It is not feasible for the [FIA\\_BLT\\_EXT.3](#) event to be audited if the rejection is performed at the HCI layer because the Bluetooth standard does not provide a notification interface for this behavior in the HCI. This is why the event is labeled as optional. However, if the rejection is performed above the HCI layer, it is expected that a conformant TOE should implement this functionality.

### 5.2.1.2 Security Management (FMT)

#### FMT\_MOF\_EXT.1 Management of Security Functions Behavior

FMT\_MOF\_EXT.1.1

There is no change to the text of this SFR. The SFR references [FMT\\_SMF\\_EXT.1](#) and states that the OS shall permit the administrator role to perform the relevant functions listed in [FMT\\_SMF\\_EXT.1](#). The function "Enable/Disable the Bluetooth interface" is listed as an optional management function in [FMT\\_SMF\\_EXT.1](#) for both users and administrators. When this PP-Module is claimed, the administrator or user role must be able to enable/disable the Bluetooth interface. In other words, the function itself is moved from optional to mandatory, but this PP-Module does not require that it be implemented by a specific role. If the ST indicates that the administrator role can perform this function, then the restrictions imposed by [FMT\\_MOF\\_EXT.1](#) will apply to it.

#### FMT\_SMF\_EXT.1 Specification of Management Functions

FMT\_SMF\_EXT.1.1

This PP-Module prescribes the following changes to this SFR as defined in the Base-PP:

- The function "Enable/disable Bluetooth interface" must be implemented, though this PP-Module does not mandate whether it be assigned to the Administrator or User role.
- The following additional management functions are defined, and should be appended to the table in the Base-PP:

Function	Administrator	User
BT-1. Configure the Bluetooth trusted channel. • Disable/enable the Discoverable (for BR/EDR) and Advertising (for LE) modes;	X	O
BT-2. Change the Bluetooth device name (separately for BR/EDR and LE);	O	O
BT-3. Provide separate controls for turning the BR/EDR and LE radios on and off;	O	O
BT-4. Allow/disallow the following additional wireless technologies to be used with Bluetooth;	O	O
BT-5. Configure allowable methods of Out of Band pairing (for BR/EDR and LE);	O	O
BT-6. Disable/enable the Discoverable (for BR/EDR) and Advertising (for LE) modes separately;	O	O
BT-7. Disable/enable the Connectable mode (for BR/EDR and LE);	O	O
BT-8. Disable/enable the Bluetooth <b>[assignment: list of Bluetooth service and/or profiles available on the OS (for BR/EDR and LE)]</b> ;	O	O
BT-9. Specify minimum level of security for each pairing (for BR/EDR and LE);	O	O

**Application Note:** The ST should indicate which of the optional management functions are implemented in the TOE. This can be done by adjusting the "Administrator" and "User" columns to "X" according to which capabilities are present or not present, and for which privilege level.

(BT-1.) Management of the Discoverable and Advertising mode and management of the Bluetooth device name are mandatory. All other management functions for Bluetooth are currently objective.

(BT-2. optional) Requires management of the Bluetooth device name separately for BR/EDR and LE radios.

(BT-4. optional) May include disabling Wi-Fi being used as a part of Bluetooth High Speed and/or disabling NFC as an Out of Band pairing method for Bluetooth. May also include other wireless technologies beyond those already specified.

(BT-8. optional) The Bluetooth services and/or profiles that may be disabled should be listed for the user or administrator either by service and/or profile name or by the types of applications for which the service and/or profile is used.

(BT-9. optional) The minimum level of security permitted may be configurable for each individual pairing or for all Bluetooth pairings.

- If the TSF supports any of the BR/EDR security modes in the following list; it should provide a mechanism for the user to choose the minimum level of security to enforce for a particular device during the pairing process: Security Mode 1 (any level); Security Mode 2; (any level); Security Mode 3; (any level); Security Mode 4; Levels 0;1;2 (aside from the services permitted to use Mode 4; Level 0 in Bluetooth Core Specification version 4.2; Vol. 3; Part C; p. 325).
- If the TSF supports any of the LE security modes in the following list; it should provide a mechanism for the user to choose the minimum level of security to enforce for a particular device during the pairing process: Security Mode 1: Levels 1, 2; Security Mode 2, (any level).

## 5.2.2 Additional SFRs

## 5.3 TOE Security Functional Requirements

---

The following section describes the SFRs that must be satisfied by any TOE that claims conformance to this PP-Module. These SFRs must be claimed regardless of which PP-Configuration is used to define the TOE.

### 5.3.1 Cryptographic Support (FCS)

#### FCS\_CKM\_EXT.8 Bluetooth Key Generation

FCS\_CKM\_EXT.8.1

The TSF shall generate public/private ECDH key pairs every [**assignment:** *frequency of and/or criteria for new key pair generation*].

**Application Note:** There are multiple acceptable ways of keeping ECDH key pairs adequately fresh, including a time-based approach such that the same key pairs will not be used for more than, for instance, 24 hours. Alternatively, the criteria might be linked to the number of passed or failed authentication attempts. As a starting point to determine reasonable authentication attempt-based replacement criteria, note that the Bluetooth specification (v4.1, Vol. 2, 5.1) suggests mitigating repeated authentication attempts by changing a device's private key after three failed authentication attempts from any BD\_ADDR, after ten successful pairings from any BD\_ADDR, or after a combination of these such that any three successful pairings count as one failed pairing.

This requirement also applies to Bluetooth LE if the TOE supports LE Secure Connections, which was introduced in version 4.2 of the specification.

### 5.3.2 Identification and Authentication (FIA)

#### FIA\_BLT\_EXT.1 Bluetooth User Authorization

FIA\_BLT\_EXT.1.1

The TSF shall require explicit user authorization before pairing with a remote Bluetooth device.

**Application Note:** User authorization includes explicit actions like affirming the remote device's name, expressing an intent to connect to the remote device, and entering relevant pairing information (e.g. PINs; numeric codes; or "yes/no" responses). The user must have to explicitly permit all pairing attempts; even when bonding is not taking place. Because explicit user action must be required to permit pairing; it must not be possible for applications to programmatically enter pairing information (e.g. PINs; numeric codes; or "yes/no" responses) during the pairing process. The absence of public APIs for programmatic authorization is not sufficient to meet this requirement; hidden or private APIs must be absent as well.

#### FIA\_BLT\_EXT.2 Bluetooth Mutual Authentication

FIA\_BLT\_EXT.2.1

The TSF shall require Bluetooth mutual authentication between devices prior to any data transfer over the Bluetooth link.

**Application Note:** If devices are not already paired, the pairing process must be initiated. If the devices are already paired, mutual authentication based on the current link key must succeed before any data passes over the link.

#### FIA\_BLT\_EXT.3 Rejection of Duplicate Bluetooth Connections

FIA\_BLT\_EXT.3.1

The TSF shall discard pairing and session initialization attempts from a Bluetooth device address (BD\_ADDR) to which an active session already exists.

**Application Note:** Session is defined as the time interval for which the TSF is actively connected to another device. Thus, the session terminates when the device disconnects from the TSF. If the TOE has an active session to a remote Bluetooth device, new session initialization and/or pairing attempts from devices claiming the same Bluetooth device address may be malicious and should be rejected/ignored. Only one session to a single remote BD\_ADDR may be supported at a time.

#### FIA\_BLT\_EXT.4 Secure Simple Pairing

FIA\_BLT\_EXT.4.1

The TOE shall support Bluetooth Secure Simple Pairing, both in the host and the controller.

FIA\_BLT\_EXT.4.2

The TOE shall support Secure Simple Pairing during the pairing process.

**Application Note:** The Bluetooth host and controller each support a particular version of the Bluetooth Core Specification and a particular set of features. Support for various features is indicated by each side during the Link Manager Protocol (LMP) Features Exchange. Refer to the Bluetooth specification [Bluetooth] for feature definitions, including the definitions of Secure Simple Pairing (Controller Support) and Secure Simple Pairing (Host Support).

## FIA\_BLT\_EXT.6 Trusted Bluetooth Device User Authorization

FIA\_BLT\_EXT.6.1

The TSF shall require explicit user authorization before granting trusted remote devices access to services associated with the following Bluetooth profiles: **[assignment:** *list of Bluetooth profiles*].

**Application Note:** In addition to pairing, it may be appropriate to require explicit user action to authorize a particular remote device to access certain Bluetooth services. The TSF may choose to require this additional action for all devices or only for those devices that do not have a required level of trust.

It is strongly preferred that for each device, the TSF maintains a list of devices trusted to use for that particular service. However, the TSF might designate certain devices as having a trusted device relationship with the TOE and granting them "blanket" access to all services.

Furthermore, it may be the case that the TSF allows movement of devices from the untrusted to the trusted category for a particular service after the user provides explicit authorization for the device to use the service. For example, it may be appropriate to require that the user provide explicit, manual authorization before a remote device may use the OBEX service for an object transfer the first time. The user might be given the option to permit future connections to that service by the particular device without requiring explicit authorization each time.

## FIA\_BLT\_EXT.7 Untrusted Bluetooth Device User Authorization

FIA\_BLT\_EXT.7.1

The TSF shall require explicit user authorization before granting untrusted remote devices access to services associated with the following Bluetooth profiles: **[assignment:** *list of Bluetooth profiles*].

**Application Note:** [FIA\\_BLT\\_EXT.7](#) differs from [FIA\\_BLT\\_EXT.6](#) because a conformant TOE may distinguish between "trusted" and "untrusted" devices such that the TSF grants "untrusted" devices access to fewer services following pairing. However, this behavior is not required; if the TSF does not treat "trusted" and "untrusted" devices any differently, the ST author may complete the assignments in [FIA\\_BLT\\_EXT.6.1](#) and [FIA\\_BLT\\_EXT.7.1](#) with lists of Bluetooth profiles.

## 5.3.3 Trusted Path/Channels (FTP)

### FTP\_BLT\_EXT.1 Bluetooth Encryption

FTP\_BLT\_EXT.1.1

The TSF shall enforce the use of encryption when transmitting data over the Bluetooth trusted channel for BR/EDR and **[selection:** *LE, no other connections*].

**Application Note:** LE is selectable because not all conformant TOEs include support for LE. If LE is supported, it is expected that the TSF be able to provide encryption for this interface. Selection of LE in [FTP\\_BLT\\_EXT.1.1](#) requires the inclusion of the selection-based SFR [FTP\\_BLT\\_EXT.3/LE](#).

FTP\_BLT\_EXT.1.2

The TSF shall use key pairs per [FCS\\_CKM\\_EXT.8](#) for Bluetooth encryption.

### FTP\_BLT\_EXT.2 Persistence of Bluetooth Encryption

FTP\_BLT\_EXT.2.1

The TSF shall **[selection:** *restart encryption, terminate the connection*] if the remote device stops encryption while connected to the TOE.

**Application Note:** Permitting devices to terminate and/or restart encryption in the middle of a connection weakens user data protection. Note that an encryption pause request, which includes a request to stop encryption, stops encryption only temporarily. This requirement is not intended to address the encryption pause feature.

**FTP\_BLT\_EXT.3/BR Bluetooth Encryption Parameters (BR/EDR)**

FTP\_BLT\_EXT.3.1/BR

The TSF shall set the minimum encryption key size to [**assignment:** *key size larger than or equal to 128 bits*] for [BR/EDR] and not negotiate encryption key sizes smaller than the minimum size.

**Application Note:** Encryption is mandatory for BR/EDR connections when both devices support Secure Simple Pairing. Minimum encryption requirements will be set and verified for each Bluetooth profile/application.

**5.4 TOE Security Functional Requirements Rationale**

---

The following rationale provides justification for each security objective for the TOE, showing that the SFRs are suitable to meet and achieve the security objectives:

**Table 2: SFR Rationale**

OBJECTIVE	ADDRESSED BY	RATIONALE
O.PLACEHOLDER	placeholder	placeholder

# 6 Consistency Rationale

## 6.1 Protection Profile for Mobile Device Fundamentals

### 6.1.1 Consistency of TOE Type

If this PP-Module is used to extend the MDF PP, the TOE type for the overall TOE is still a mobile device. However, one of the functions of the device must be the ability for it to have Bluetooth capability. The TOE boundary is simply extended to include that functionality.

### 6.1.2 Consistency of Security Problem Definition

The threats, assumptions, and OSPs defined by this PP-Module (see section 3.1) supplement those defined in the MDF PP as follows: The threats that apply to this PP-Module are inherited from the Base-PP to which the TOE also conforms. This PP-Module does not add or remove any elements to the security problem definition given in the MDF PP.

PP-Module Threat, Assumption, OSP	Consistency Rationale
-----------------------------------	-----------------------

T.PLACEHOLDER	placeholder
---------------	-------------

P.PLACEHOLDER	
---------------	--

### 6.1.3 Consistency of Objectives

The objectives that apply to this PP-Module are inherited from the Base-PP to which the TOE also conforms. This PP-Module does not add or remove any elements to the objectives given in the MDF PP. The objectives for the TOEs are consistent with the MDF PP based on the following rationale:

PP-Module TOE Objective	Consistency Rationale
-------------------------	-----------------------

O.PLACEHOLDER	
---------------	--

### 6.1.4 Consistency of Requirements

This PP-Module identifies several SFRs from the MDF PP that are needed to support Bluetooth functionality. This is considered to be consistent because the functionality provided by the MDF PP is being used for its intended purpose. The PP-Module also identifies a number of modified SFRs from the MDF PP that are used entirely to provide functionality for Bluetooth. The rationale for why this does not conflict with the claims defined by the MDF PP are as follows:

PP-Module Requirement	Consistency Rationale
Modified SFRs	
FAU_GEN.1	The ST author is instructed to add new auditable events for Bluetooth functionality; the SFR behavior itself is otherwise unmodified.
FMT_SMF_EXT.1	The ST author is instructed to complete an assignment in the SFR with information related to Bluetooth, and to include additional management functions in this SFR based on the Bluetooth capability defined by the PP-Module.
Mandatory SFRs	
FCS_CKM_EXT.8	This SFR applies to the frequency of key generation activity. This does not conflict with the Base-PP because it involves a key generation mechanism defined in the Base-PP and relates exclusively to Bluetooth functionality so it does not affect any other key generation activities required by the Base-PP.
FIA_BLT_EXT.1	This SFR applies to the establishment of Bluetooth connectivity, which is behavior not described in or prevented by the Base-PP.
FIA_BLT_EXT.2	This SFR applies to the establishment of Bluetooth connectivity, which is behavior not described in or prevented by the Base-PP.
FIA_BLT_EXT.3	This SFR applies to the establishment of Bluetooth connectivity, which is behavior not described in or prevented by the Base-PP.
FIA_BLT_EXT.4	This SFR applies to the establishment of Bluetooth connectivity, which is behavior not described in or prevented by the Base-PP.
FIA_BLT_EXT.6	This SFR applies to the establishment of Bluetooth connectivity, which is behavior not described in or prevented by the Base-PP.

<a href="#">FIA_BLT_EXT.7</a>	This SFR applies to the establishment of Bluetooth connectivity, which is behavior not described in or prevented by the Base-PP.
<a href="#">FTP_BLT_EXT.1</a>	This SFR applies to encryption of Bluetooth communications. This is a trusted channel that is not discussed in the Base-PP, but it relies on the same cryptographic algorithms specified in the Base-PP to function.
<a href="#">FTP_BLT_EXT.2</a>	This SFR applies to encryption of Bluetooth communications. This is a trusted channel that is not discussed in the Base-PP, but it relies on the same cryptographic algorithms specified in the Base-PP to function.
<a href="#">FTP_BLT_EXT.3</a>	
<a href="#">FTP_BLT_EXT.3/BR</a>	This SFR applies to encryption of Bluetooth communications. This is a trusted channel that is not discussed in the Base-PP, but it relies on the same cryptographic algorithms specified in the Base-PP to function.

#### Optional SFRs

This PP-Module does not define any Optional requirements.

#### Selection-based SFRs

<a href="#">FTP_BLT_EXT.3/LE</a>	This SFR applies to encryption of Bluetooth communications. This is a trusted channel that is not discussed in the Base-PP, but it relies on the same cryptographic algorithms specified in the Base-PP to function.
----------------------------------	--

#### Objective SFRs

<a href="#">FIA_BLT_EXT.5</a>	This SFR applies to the establishment of Bluetooth connectivity, which is behavior not described in or prevented by the Base-PP.
-------------------------------	--

#### Implementation-Dependent SFRs

This PP-Module does not define any Implementation-Dependent requirements.

## 6.2 Protection Profile for General Purpose Operating Systemss

### 6.2.1 Consistency of TOE Type

If this PP-Module is used to extend the [GPOS PP], the TOE type for the overall TOE is still a generic operating system. However, one of the functions of the generic operating system must be the ability for it to have Bluetooth capability. The TOE boundary is simply extended to include that functionality.

### 6.2.2 Consistency of Security Problem Definition

The threats, assumptions, and OSPs defined by this PP-Module (see section 3.1) supplement those defined in the GPOS PP as follows: The threats that apply to this PP-Module are inherited from the Base-PP to which the TOE also conforms. This PP-Module does not add or remove any elements to the security problem definition given in the GPOS PP.

#### PP-Module Threat, Assumption, OSP Consistency Rationale

<a href="#">T.PLACEHOLDER</a>	placeholder
<a href="#">P.PLACEHOLDER</a>	

### 6.2.3 Consistency of Objectives

The objectives that apply to this PP-Module are inherited from the Base-PP to which the TOE also conforms. This PP-Module does not add or remove any elements to the objectives given in the GPOS PP. The objectives for the TOEs are consistent with the GPOS PP based on the following rationale:

#### PP-Module TOE Objective Consistency Rationale

<a href="#">O.PLACEHOLDER</a>
-------------------------------

### 6.2.4 Consistency of Requirements

This PP-Module identifies several SFRs from the GPOS PP that are needed to support Bluetooth functionality. This is considered to be consistent because the functionality provided by the GPOS PP is being used for its intended purpose. The PP-Module also identifies a number of modified SFRs from the GPOS PP that are used entirely to provide functionality for Bluetooth. The rationale for why this does not conflict with the claims defined by the GPOS PP are as follows:

PP-Module Requirement	Consistency Rationale
<b>Modified SFRs</b>	
FAU_GEN.1	The ST author is instructed to add new auditable events for Bluetooth functionality; the SFR behavior itself is otherwise unmodified.
FMT_MOF_EXT.1	The ST author is required to associate all claimed management functions with the administrative privileges required to execute them. This PP-Module simply extends this requirement to apply to the management functions added and mandated by the PP-Module.
FMT_SMF_EXT.1	The ST author is required to include an optional management function defined in the Base-PP that relates to Bluetooth, and to include additional management functions in this SFR based on the Bluetooth capability defined by the PP-Module.
<b>Mandatory SFRs</b>	
FCS_CKM_EXT.8	This SFR applies to the frequency of key generation activity. This does not conflict with the Base-PP because it involves a key generation mechanism defined in the Base-PP and relates exclusively to Bluetooth functionality so it does not affect any other key generation activities required by the Base-PP.
FIA_BLT_EXT.1	This SFR applies to the establishment of Bluetooth connectivity, which is behavior not described in or prevented by the Base-PP.
FIA_BLT_EXT.2	This SFR applies to the establishment of Bluetooth connectivity, which is behavior not described in or prevented by the Base-PP.
FIA_BLT_EXT.3	This SFR applies to the establishment of Bluetooth connectivity, which is behavior not described in or prevented by the Base-PP.
FIA_BLT_EXT.4	This SFR applies to the establishment of Bluetooth connectivity, which is behavior not described in or prevented by the Base-PP.
FIA_BLT_EXT.6	This SFR applies to the establishment of Bluetooth connectivity, which is behavior not described in or prevented by the Base-PP.
FIA_BLT_EXT.7	This SFR applies to the establishment of Bluetooth connectivity, which is behavior not described in or prevented by the Base-PP.
FTP_BLT_EXT.1	This SFR applies to encryption of Bluetooth communications. This is a trusted channel that is not discussed in the Base-PP, but it relies on the same cryptographic algorithms specified in the Base-PP to function.
FTP_BLT_EXT.2	This SFR applies to encryption of Bluetooth communications. This is a trusted channel that is not discussed in the Base-PP, but it relies on the same cryptographic algorithms specified in the Base-PP to function.
FTP_BLT_EXT.3	
FTP_BLT_EXT.3/BR	This SFR applies to encryption of Bluetooth communications. This is a trusted channel that is not discussed in the Base-PP, but it relies on the same cryptographic algorithms specified in the Base-PP to function.
<b>Optional SFRs</b>	
This PP-Module does not define any Optional requirements.	
<b>Selection-based SFRs</b>	
FTP_BLT_EXT.3/LE	This SFR applies to encryption of Bluetooth communications. This is a trusted channel that is not discussed in the Base-PP, but it relies on the same cryptographic algorithms specified in the Base-PP to function.
<b>Objective SFRs</b>	
FIA_BLT_EXT.5	This SFR applies to the establishment of Bluetooth connectivity, which is behavior not described in or prevented by the Base-PP.
<b>Implementation-Dependent SFRs</b>	
This PP-Module does not define any Implementation-Dependent requirements.	

# Appendix A - Optional SFRs

## A.1 Strictly Optional Requirements

---

This PP-Module does not define any Strictly Optional SFRs.

## A.2 Objective Requirements

---

### A.2.1 Identification and Authentication

#### FIA\_BLT\_EXT.5 Bluetooth Secure Connections

FIA\_BLT\_EXT.5.1

The TOE shall support Secure Connections Only mode for Bluetooth BR/EDR and [**selection:** *Bluetooth LE, no other Bluetooth protocol*].

**Application Note:** The specification states that Secure Connections Only Mode, also called "FIPS Mode," should be used when security is more important than backwards compatibility. From the specification, "The Host will enforce that the P-256 elliptic curve is used during pairing; the secure authentication sequences are used; and AES-CCM is used for encryption." Also, "if a BR/EDR/LE device is configured in Secure Connections Only Mode, then a transport will only be used when Secure Connections is supported by both devices."

# Appendix B - Selection-based Requirements

## B.1 Trusted Path/Channels

### FTP\_BLT\_EXT.3/LE Bluetooth Encryption Parameters (LE)

FTP\_BLT\_EXT.3.1/LE

The TSF shall set the minimum encryption key size to [**assignment:** *key size larger than or equal to 128 bits*] for [*LE*] and not negotiate encryption key sizes smaller than the minimum size.

**Application Note:** To conform to this PP-Module, the TOE must implement encryption for Bluetooth BR/EDR as required by [FTP\\_BLT\\_EXT.1.1](#). A conformant TOE does not need to support Bluetooth LE; however, if it does, then it must also support encryption for it. [FTP\\_BLT\\_EXT.3/LE](#) must therefore be claimed if 'LE' is selected in [FTP\\_BLT\\_EXT.1.1](#).

# Appendix C - Extended Component Definitions

This appendix contains the definitions for all extended requirements specified in the PP-Module.

## C.1 Extended Components Table

All extended components specified in the PP are listed in this table:

**Table 3: Extended Component Definitions**  
**Functional Class    Functional Components**

--

## C.2 Extended Component Definitions

### FCS\_CKM\_EXT Cryptographic Key Management

#### Family Behavior

Components in this family define requirements for cryptographic key management beyond those which are specified in the Part 2 family FCS\_CKM.

### FIA\_BLT\_EXT Bluetooth Pairing

#### Family Behavior

Components in this family define Bluetooth-specific identification and authentication requirements.

### FTP\_BLT\_EXT Bluetooth Trusted Communications

#### Family Behavior

Components in this family define requirements for Bluetooth encryption.

#### Component Leveling

[FTP\\_BLT\\_EXT.3/BR](#), Bluetooth Encryption Parameters (BR/EDR),

#### Management: FTP\_BLT\_EXT.3/BR

There are no management functions foreseen.

#### Audit: FTP\_BLT\_EXT.3/BR

There are no audit events foreseen.

#### FTP\_BLT\_EXT.3/BR Bluetooth Encryption Parameters (BR/EDR)

Hierarchical to: No other components.

Dependencies to: No dependencies.

#### FTP\_BLT\_EXT.3.1/BR

The TSF shall set the minimum encryption key size to [**assignment:** *key size larger than or equal to 128 bits*] for [BR/EDR] and not negotiate encryption key sizes smaller than the minimum size.

#### Component Leveling

[FTP\\_BLT\\_EXT.3/LE](#), Bluetooth Encryption Parameters (LE),

#### Management: FTP\_BLT\_EXT.3/LE

There are no management functions foreseen.

#### Audit: FTP\_BLT\_EXT.3/LE

There are no audit events foreseen.

#### FTP\_BLT\_EXT.3/LE Bluetooth Encryption Parameters (LE)

Hierarchical to: No other components.

Dependencies to: No dependencies.

### FTP\_BLT\_EXT.3.1/LE

The TSF shall set the minimum encryption key size to [**assignment:** *key size larger than or equal to 128 bits*] for [*LE*] and not negotiate encryption key sizes smaller than the minimum size.

# Appendix D - Implicitly Satisfied Requirements

This appendix lists requirements that should be considered satisfied by products successfully evaluated against this PP-Module. However, these requirements are not featured explicitly as SFRs and should not be included in the ST. They are not included as standalone SFRs because it would increase the time, cost, and complexity of evaluation. This approach is permitted by [CC] Part 1, 8.2 Dependencies between components.

This information benefits systems engineering activities which call for inclusion of particular security controls. Evaluation against the PP-Module provides evidence that these controls are present and have been evaluated.

Requirement	Rationale for Satisfaction
FCS_CKM.1 - Cryptographic Key Generation	<a href="#">FCS_CKM_EXT.8</a> has a dependency on FCS_CKM.1 for the generation of ECDH key pairs. This dependency is implicitly satisfied in this PP-Module because both Base-PPs the PP-Module is intended to extend define this SFR and specify ECDH key generation as a required capability of the TOE. Therefore, a conformant TOE will always have this capability.
FPT_STM.1 - Reliable Time Stamps	<a href="#">FCS_CKM_EXT.8</a> has a dependency on FPT_STM.1 because key generation may be triggered by a given time period elapsing. When the TOE claims conformance to <a href="#">[MDF]</a> , this dependency is satisfied explicitly through the Base-PP's definition of FPT_STM.1. When the TOE claims conformance to <a href="#">[GPOS]</a> , this dependency is satisfied implicitly through that PP's A.PLATFORM assumption of a trustworthy computing platform, which can be reasonably assumed to include a hardware real-time clock.

# Appendix E - Entropy Documentation and Assessment

The TOE does not require any additional supplementary information to describe its entropy sources beyond the requirements outlined in the Base-PPs.
